Contents

1. Introduction	2
2. Manual Testing	2

1. Introduction

As our project is a research based and most importantly Prediction based so it's testing can't be done before the actual event happens (i.e. Election's result been declared).

2. Manual Testing

As per sentiment analysis, the sentiment given to tweets can be tested. And it's been tested manually (whether the sentiment given to tweets by our program and manual are same or not). But even sentiment is bit perspective (context) based, so it may vary but nearly the manual testing gave **"90%+"** Accuracy.
